 "Occupational Health for all: from research to practice"

## "Biological monitoring for occupational and environmental health risk assessment"

*Arnulfo Albores and Balam Muñoz*

Can Cun, QR., Mexico, March :

## Content

1. General concepts
2. Biological monitoring in occupational settings
3. Molecular biology contributions to occupational health
4. "Omics" data for risk assessment in occupational settings
5. Perspectives of biology techniques in the occupational environment

30th International Congress on Occupational Health

## Introduction

- Workers represent **half** the world's population
- Workers health is **the task force** that maintain world's production
- Workers' health might be affected by **environmental contaminants**

GLOBAL PLAN OF ACTION ON WORKERS' HEALTH 2008–2017. WHO.

30th International Congress on Occupational Health

## Introduction...

- Therefore, the aim of the biological monitoring is **to provide reliable data** to perform accurate human risk assessments based on the **most sensitive chemical** and biological methods, thus
- **New** chemical and biological methods need to be developed

30th International Congress on Occupational Health

## Introduction....

Then, it is required:

- **Innovation** in chemical and biological analytical techniques to monitor both the occupational environment (chemical monitoring) and workers health effects (biological monitoring)
- Up to date methods provide reliable data necessary to devise **effective** and **efficient** solutions to and/or prevent occupational health risks

GLOBAL PLAN OF ACTION ON WORKERS' HEALTH 2008–2017. WHO.

30th International Congress on Occupational Health

## Introduction...

- Molecular biology techniques are **new tools** potentially useful to evaluate health effects caused by chemical exposure in occupational settings.

30th International Congress on Occupational Health

## General Concepts

- Any industry whose operations handle toxic materials must **identify, assess and monitor** employees exposure and the effect of these hazards
- A **sanitary strategy** to guaranty health conditions in the workplace has to be implemented
- An **effective biological monitoring program** includes: relevant issues of the health and safety legislation, identification of relevant issues appropriate for biological monitoring and, full technical supervision

30th International Congress on Occupational Health

## Monitoring Strategy

- Identification** of all hazardous chemicals in the workplace
- Estimate the potential and actual **exposure** of workers that may come in contact with the hazardous chemical
- Hazardous chemicals should be **constantly tested** throughout the process
- Consider all **routes of exposure**

30th International Congress on Occupational Health

## Factors influencing the extent of contamination exposure

- Physical and chemical** characteristics of the contaminants
- Occupational environmental conditions**
- Status of the workers protection equipment**
- Routes of exposure**
- Workers individuality**

30th International Congress on Occupational Health

## Workers Individuality

- **Hygiene habits**
- **Age**
- **Gender**
- **Fitness level**
- **Genotype**

30th International Congress on Occupational Health

## Properties of a useful "biomarker"

A good **biomarker** useful for an specific chemical class or an specific mechanism should be:

- The "biomarker should be **inducible** or repress by external agents,
- The response should be **specific** for a chemical family ,
- The response should be **sensitive** enough to the aggression in order to be detected routinely
- The biomarker should be precise and reproducible among experiments in a laboratory and in different laboratories and study or experimental models,
- The biomarker quantitation should be useful to estimate the risk level

Benninghoff AD, (2007) Tox Sci., 95: 1-4

30th International Congress on Occupational Health

## BIOLOGICAL MONITORING

- **Measurement and assessment** of chemicals or their metabolites (substances the body converts into) in exposed workers
- Measurements are performed in **body samples**
- Biological monitoring measurements **reflect the total uptake** of a chemical by an individual through all routes (inhalation, ingestion, skin absorption or combinations)

30th International Congress on Occupational Health

# "OMICS"

## THE SCIENCE OF INTEGRATION

# "Omics"

➤ "Omics" simultaneously detects changes in gene expression, proteins content and activity, as well as metabolites' content by applying high performance technologies

Benninghoff AD, (2007) *Tox Sci.*, 95: 1-4

30th International Congress on Occupational Health

30th International Congress on Occupational Health

## ENVIRONMENT "OMICS" AND HEALTH

Modified from: Vlaanderen, et al. (2010) *Occup. Environ. Med.* 67:1336-143

30th International Congress on Occupational Health

## Gene Expression

- There are several routine techniques such as:
  - PCR and microarrays, to evaluate gene SNPs or their expression by measuring mRNA, or
  - ELISA, to assess protein levels

30th International Congress on Occupational Health

## Microarrays

- Recently, the use of microarrays has several **applications** in chemical exposure evaluation

Castorena-Torres, F. et al., *Toxicol. In Vitro* 2007.

30th International Congress on Occupational Health

30th International Congress on Occupational Health

Use of microarrays to analyze exposure to toxicants

Castorena-Torres, F. et al., Toxicol. In Vitro 2007.

30th International Congress on Occupational Health

Real time PCR

- PCR applications to genetic and molecular toxicology assessment:
  - detection of genetic polymorphisms
  - quantification of chromosomal DNA deletions, and
  - quantification of gene expression

30th International Congress on Occupational Health

Real time qPCR for gene expression analysis

Real-time PCR analysis of differential expression of genes modulated by PAH (obtained from a coke oven factory) or BaP treatments in HepG2 (A) and A549 (B) cells.

Castorena-Torres, F. et al., Toxicol. In Vitro, 2007.

30th International Congress on Occupational Health

Gene	Alleles	Frequency	Reference
GlycA	CC	0.71	[1]
GlycA	CT	0.29	[1]
GlycA	TT	0.00	[1]
IL1A	CC	0.33	[2]
IL1A	CT	0.67	[2]
IL1A	TT	0.00	[2]
IL1B	CC	0.33	[2]
IL1B	CT	0.67	[2]
IL1B	TT	0.00	[2]

← Genotype frequencies in a Tepehuanes population

← There is an enormous variation in allele frequencies among human populations

Reyes-Hernandez (2008) 81, 97-103

30th International Congress on Occupational Health

METABOLOMICS

Metabolomics (Oliver, 1998) “the set of metabolites synthesized by a biological system”

- Takes into account all the **small molecules** present in in an organism, tissue, cell, or body fluid
- **Metabolites** are the smallest molecules and primary actors in the life processes. Therefore, changes in their structure and/or concentrations might reflect relevant biological changes for the organism health

30th International Congress on Occupational Health

Johnson CH et al., Ann. Rev. Pharmacol. Toxicol. 2012, 52: 37-56.

Genomic, exposomic and personal variations on individual metabolotypes and metabolomes

Johnson CH et al., Ann. Rev. Pharmacol. Toxicol. 2012, 52: 37-56.

30th International Congress on Occupational Health

## METABOLOMICS (2)

### METABOTYPE

- Includes all genome, environmental and individual microflora modifications that participate in the metabolic transformations that undergo chemicals internalized in an individual

Johnson CH et al., Ann. Rev. Pharmacol. Toxicol. 2012, 52: 37-56.  
30th International Congress on Occupational Health

## Metabolomics and Xenobiotics

Through **METABOLOMICS** it is possible to identify **new intermediate compounds**, product of their biotransformation, and establish **novel mechanism** of toxicity

Johnson CH et al., Ann. Rev. Pharmacol. Toxicol. 2012, 52: 37-56.  
30th International Congress on Occupational Health

## TOXICO-METABOLOMICS

Toxico-metabolomics is useful for:

- Producing data that, by using mathematical models, are useful to foresee the fate and effects caused by a contaminant.
- Helps to foresee the hazardous outcome and secondary effects produced by a chemical
- The metabolome is difficult to study due to diversity in genomes and environmental factors to which an individual is exposed
- Metabolome studies in human populations should ensure: a) a sufficient statistical power; b) genomic and metabolomic tools had the capacity to detect changes in biological systems

Johnson CH et al., Ann. Rev. Pharmacol. Toxicol. 2012, 52: 37-56.  
30th International Congress on Occupational Health

## Typical difficulties of meabolome studies in human

- There are considerable variations in phase I and phase II drug metabolims enzymes that affect xenobiotics pharmacokinetics, pharmacodinamics and elimination
- Limited usefulness of animal models in the human situation
- Usefulness of transgenic animal models

Johnson CH et al., Ann. Rev. Pharmacol. Toxicol. 2012, 52: 37-56.  
30th International Congress on Occupational Health

## Other Omics complications

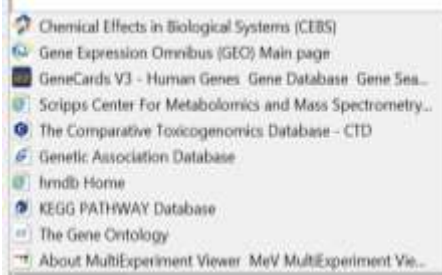

- Profile effects of chemical contaminants differ among species
- Molecules with diverse chemical structure may produce similar responses
- An "omic study" is an puntual image of effects caused by a chemical contaminant
- In fact, effects observed in human populations result for exposure to chemical mixtures, thus their study are extremely complex
- Chemical exposure is just one factor in the work environment

Benninghoff AD, (2007) Tox Sci., 95: 1-4

30th International Congress on Occupational Health

The Vanishing Zero Paradigm in Occupational Health

- ❖ Ever increasing sensitivity of analytical techniques
  - Adequation of **NON-DETECTABLE** definition to FEMTO or ATTOMOLE levels.
- ❖ Genomics is able to **assess global cell response** to exposure as a function of dose.
- ❖ Transcription allows damage detection at **doses** much lower than those necessary to observe histopathology changes.
- ❖ Omics provides **mechanistically based data** to risk assessment and dose response data, providing the non-transcriptional effect level (NOTEL) which is linked to **receptors**.

Zarbl H, et al. (2010) Chem-Biol-Interact. 273-278

30th International Congress on Occupational Health

## Future Issues in Omics Research

*Rosalind Franklin*  
The Lady of DNA

- **Construction** of "omics" data bases
- **Development** of mathematical tools to integrate human population data (including inter-individual variation) and environmental characteristics
- **Identify and solve** specific problems applying "omics" criteria

30th International Congress on Occupational Health

## Ethical Issues in Molecular Biology Studies in Occupational Health

Respect to the autonomy of the participant:

- Written informed consent and withdrawal at any time
- Access to personal information (right to know and right to not know the study result)
- Securing proper managing data (data protection to avoid misuse in employment, insurance, learning and learning opportunities)
