## Outline

- Chronic exposure ?
- Neurotoxic substances ?
- What do we have ? How do we gather data for information? And what is its use?
- Exposure and Effect relationship-- Chronic exposure
- Senses?
- **(Chronic) exposure evaluation for sensory system**
- Any neglect in occupational health practice-evaluation-situation?: importance-possibilities-resources-records-reports?
- What do we need?

## Chronic exposure definition?

- a. Long term exposure, usually lasting one year to a lifetime. [CARB, 2000: Glossary of Air Pollution Terms];
- b. Multiple exposures occurring over an extended period of time, or a significant fraction of the animal's or the individual's lifetime. [IRIS, 1999: Glossary of IRIS Terms];
- c. A long term exposure to a chemical for a period of one year or more in animals and **more than seven years in humans**. [OFA, 2000: Oxyfuels Glossary];
- d. A persistent, recurring, or long term exposure, as distinguished from acute. Chronic exposure may result in health effects (such as cancer) that are delayed in onset, occurring long after exposure has ceased. [REAP, 1995: Residential Exposure Assessment Project];
- e. Multiple exposures occurring over an extended period of time, or a significant fraction of the animal's or the individual's life\_time. [USDOE, 2000: RAIS Glossary];
- f. Long\_term exposure usually **lasting 6 months to a lifetime**. [USEPA, 1995: Benchmark Dose];
- g. Multiple exposures occurring over an extended period of time or over a significant fraction of an animal's or human's lifetime (Usually seven years to a lifetime.) [USEPA, 1997a: EPA Terms of Environment];
- h. Exposure to the poison occurs over a period of weeks, months, or years; onset of signs may be sudden and dramatic, or can be insidious like a slow loss in body condition or reduced productivity. [WSU, 1999: Definitions and Abbreviations of Veterinary Terms]

## ATSDR

**Acute = 1 to 14 days,**  
**Intermediate = 15 to 364 days, and**  
**Chronic = 1 year or longer**

**Neurotoxic Substances**

- 1,1,1-Trichloroethane
- 1,1,2-Trichloroethane
- 1,1-Dichloroethene
- 1,2-Dichloropropane
- 1,3-Butadiene
- 2,4- & 2,6-Dinitrotoluene
- 2-Hexanone
- Acetone
- Acrylamide
- Acrylonitrile
- Aldrin/Dieldrin
- Aluminum
- Americium
- Arsenic
- Benzene
- Bis(chloromethyl) Ether
- Bromoform & Dibromochloromethane
- Bromomethane
- Cadmium
- Carbon Disulfide
- Carbon Monoxide
- Carbon Tetrachloride
- Chlordane
- Chlordecone
- Chlorfenvinphos
- Chlorine Dioxide & Chlorite
- Chlorobenzene
- Chloroform
- Chloromethane
- Chlorpyrifos
- Cresols

- Cresols
- Cyanide
- DDT, DDE, DDD
- Diazinon
- Dichlorvos/Dinitrocresols
- Disulfoton
- Endosulfan
- Endrin/Endrin aldehyde
- Ethion
- Ethylbenzene
- Ethylene Oxide
- Fuel Oils / Kerosene
- Gasoline, Automotive
- Heptachlor/Heptachlor Epoxide
- Hexachlorocyclohexane (HCH)
- Hexachloroethane
- HMX (Octogen)
- Hydraulic Fluids
- Hydrogen Sulfide
- Ionizing Radiation
- Jet Fuels JP-4 and JP-7
- Jet Fuels JP-5 and JP-8
- Lead
- Malathion
- Manganese
- Mercury
- Metallic Mercury
- Methoxychlor
- Methyl Mercaptan
- Methyl Parathion
- Methyl tert-Butyl Ether (MTBE)
- Methylene Chloride
- Naphthalene, 1-Methylnaphthalene, 2-Methylnaphthalen

- Otto Fuel II and its Components
- Polychlorinated Biphenyls (PCBs)
- Pyrethrins and Pyrethroids
- Pyridine
- RDX (Cyclonite)
- Stoddard Solvent
- Styrene
- Tetrachloroethylene (PERC)
- Tetryl
- Thallium
- Tin and Compounds
- Toluene
- Trichloroethylene (TCE)
- Used Mineral-based Crankcase Oil
- Xylenes

**Styrene**

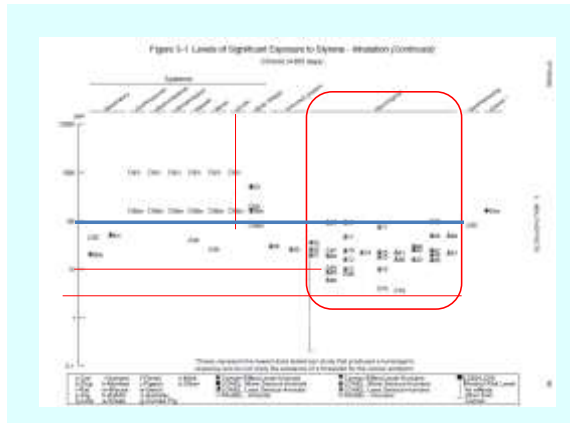

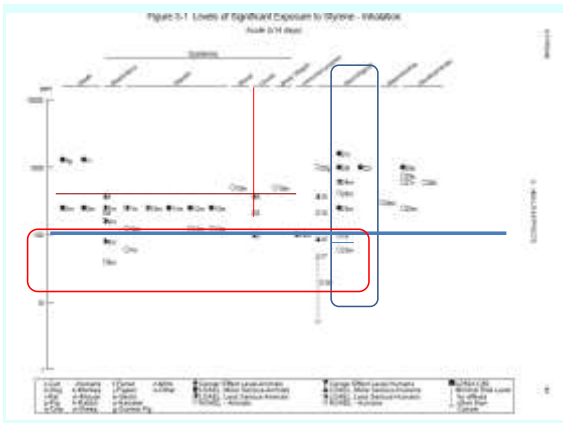

<http://www.atsdr.cdc.gov/substances/toxsubstance.asp?toxid=74>

<p><b>Uses</b></p> <ul style="list-style-type: none"> <li>- Manufacturing</li> <li>- Consumer products</li> </ul>	<p>Large amounts of styrene are produced in the United States. Small amounts are produced naturally by plants, bacteria, and fungi. Styrene is also present in combustion products such as cigarette smoke and automobile exhaust.</p> <p>Styrene is widely used to make plastics and rubber. Consumer products containing styrene include:</p> <ul style="list-style-type: none"> <li>• packaging materials</li> <li>• insulation for electrical uses (i.e., wiring and appliances)</li> <li>• insulation for homes and other buildings</li> <li>• fiberglass, plastic pipes, automobile parts</li> <li>• drinking cups and other "food-use" items</li> <li>• carpet backing</li> </ul> <p>These products mainly contain styrene linked together in long chains (polystyrene). However, most of these products also contain a small amount of unlinked styrene.</p>

**Table 2-1. Results of Selected Human Neurotoxicity Studies**

Effect	Reference	NOAEL ppm	LOAEL ppm
Decreased color discrimination	Chen et al. 1994	5	5
	Kido et al. 2001	6	10
	Gong et al. 2002		10
	Gobbio et al. 1991		16
	Trebing et al. 2001		20
	Ingen et al. 2005		22
Neurological symptoms	Falke et al. 1992	24.3	34.3
	Compagnon et al. 1991		26
	Epstein et al. 1985	8	83
	Flede et al. 1989	6	
	Edling et al. 1992	8.6	
	Chackoway et al. 1992	10.8	18.9
Vestibular effects	Cherry et al. 1980	62	
	Moller et al. 1990	18	18
Hearing	Tripple et al. 2006		24.8
	Calabrese et al. 1996		38
	Morita et al. 2002		3.08
	Shiohata-Koshiba et al. 2003		15.6
	Morika et al. 1986		16
	Moller et al. 1990	18	
	Calabrese et al. 1995	38	
	Trebing et al. 2009	49	58

Reference	Number of workers	Mean duration of exposure (years)	MQAL, ppm	LOAD, ppm	Comments
Wagner et al. 2001	12	12.5-17.5 (average 14.3)	0.2	2.0	2,000 weighted average in-house calculation for each worker using historical exposure data. There were no significant differences in calculated airway lesions.
Fisher et al. 1982	33	6.6 (range 1-25)	0.2	24.3	Significant difference in the number of subjects with airway lesions in the high group or in the low group, no significant difference in calculated airway lesions.
Comstock et al. 1986	170	5.3 or 6.0	0.2	26	Significant threshold of impaired C2, was 4 ppm in the upper back of the C2 area, 25.7 ppm.
Equity et al. 1989	17	7.8 (range 3.2-20.1)	0.2	40	Significant difference in C2C3 between age-matched workers and controls. Workers divided into two groups—significant difference in C2C3 between high concentration workers (mean of 5.02 g/L, range 0.24-24.2 g/L), and low concentration workers (mean of 0.23 g/L, range 0.02-1.02 g/L). Significant difference in C2C3 between high concentration workers (mean of 5.02 g/L, range 0.24-24.2 g/L) and low concentration workers (mean of 0.23 g/L, range 0.02-1.02 g/L). Workers divided into three groups (low, medium, high) based on urinary M1 and M2 levels. No significant differences in C2C3 score or renal workload sensitivity were observed between groups. No associations were found when workers were divided into groups with long duration high exposure (up to 27 ppm for over 15 years) and short duration low exposure. Interpretation of these results is limited by the lack of a control group.

ATSDR Minimal Risk Levels (MRLs) - February 2012							
Route	Duration	MRL	Factors	Endpoint	Draft/Date	Cover Date	CAS Number
<b>STYRENE</b>							
Inh.	Acute	5 ppm	10	NeuroL.	Final	11/2010	100-42-5
Inh.	Chr.	0.2 ppm	30	NeuroL.	Final	11/2010	100-42-5
Oral	Acute	0.1 mg/kg/day	1000	NeuroL.	Final	11/2010	100-42-5

**Table 8-1. Regulations, Advisories, and Guidelines Applicable to Styrene**

Agency	Description	Information	Reference
INTERNATIONAL			
Guidelines:			
IARC	Carcinogenicity (classification)	Group 2B*	IARC 2000
WHO	Air quality guidelines	0.20 mg/m <sup>3</sup>	WHO 2000
	*This is based on effects other than cancer or carcinogenesis using averaging time of 1 week		
	Based on sensory effects or irritant reactions, using an averaging time of 30 minutes		
	Derivation threshold	0.07 mg/m <sup>3</sup>	
	Resuspension threshold	0.21-0.28 mg/m <sup>3</sup>	
	Guideline value	0.07 mg/m <sup>3</sup>	
	Drinking water quality guidelines	0.02 mg/L*	WHO 2004

<http://www.cdc.gov/niosh/docs/2004-101/calc.htm>  
 The conversion equation is based on 25 °C and 1 atmosphere

X ppm = (Y mg/m<sup>3</sup>)(24.45)/(molecular weight)  
 or  
 Y mg/m<sup>3</sup> = (X ppm)(molecular weight)/24.45

0.061 ppm

<b>CAS #</b> 5000-78-3 <b>STICS #</b> 101 <b>EC Number</b> 201-200-8 <b>ECB/CIS #</b> 201-200-8	<b>ECAD #</b> W636000 <b>WLN #</b> 205 <b>EC Number</b> 201-200-8 <b>ECB/CIS #</b> 201-200-8	<b>Vinylbenzene</b> <b>Polystyrene</b> <b>Chlorostyrene</b> $C_8H_8$ , $C_8H_7Cl$ , $C_8H_6Cl_2$ <b>Molecular mass:</b> 104.2	
<b>TYPE OF HAZARD / EXPOSURE</b>	<b>ACUTE HAZARDS / SYMPTOMS</b>	<b>PREVENTION</b>	<b>FIRST AID / FIRE FIGHTING</b>
<b>FIRE</b>	Flammable. Onset of swelling or inflammation (or pruritus) of a skin.	Use open flames, NO smoking, and NO welding.	Dry powder. Foam. Carbon dioxide.
<b>EXPLOSION</b>	Above 37°C explosion suppressant effect may be lost. See MSDS.	Above 37°C risk of blood coagulation, embolism, and exposure of medical equipment.	In case of this being drawn into, used by spraying with water.
<b>EXPOSURE</b>		<b>STRICT HYGIENE:</b>	
<b>Inhalation</b>	Irritation: Coughing, Headache, Nausea, Vomiting, Anorexia, Headaches.	Ventilate, local exhaust, or breathing protection.	Flush air, wet (Aid to medical attention).
<b>Skin</b>	Irritation: Pain.	Protective clothing (Protective gloves).	Remove contact (clothing). Flush and then wash skin with water and soap.
<b>Eyes</b>	Irritation: Pain.	Subsidiary goggles, or eye protection if considered with breathing protection.	If eye area with plenty of water for several minutes (remove contact lenses if easily possible), then take to a doctor.
<b>Ingestion</b>	Nausea, Vomiting.	Do not eat, drink, or smoke during work.	Drink milk. Do NOT induce vomiting. Give plenty of water to drink. Flush.
			

STYRENE		ICSC: 0073	
<b>IMPORTANT DATA</b>			
<b>PHYSICAL STATE, APPEARANCE</b> COLORLESS TO YELLOW OIL LIQUID		<b>ROUTES OF EXPOSURE</b> The substance can be absorbed into the body by inhalation of its vapour.	
<b>CHEMICAL DANGERS</b> The substance can be explosive peroxide. The substance may polymerize due to moisture, under the influence of light, oxidant, oxygen, and peroxide. (strong fire and explosion hazard) Reacts vigorously with strong acids, strong oxidants causing fire and explosion hazard. Insoluble in water, organic and inorganic solvents.		<b>IRITATION RISK</b> A harmful combination of the air not be reached either directly or by deposition of the substance on the skin.	
<b>OCCUPATIONAL EXPOSURE LIMITS</b> TLV: 20 ppm (TWA), 40 ppm (STEL). All limit applicable as a human carcinogen, (R1) (R2) (R3) (R4) (R5) (R6) (R7) (R8) (R9) (R10) (R11) (R12) (R13) (R14) (R15) (R16) (R17) (R18) (R19) (R20) (R21) (R22) (R23) (R24) (R25) (R26) (R27) (R28) (R29) (R30) (R31) (R32) (R33) (R34) (R35) (R36) (R37) (R38) (R39) (R40) (R41) (R42) (R43) (R44) (R45) (R46) (R47) (R48) (R49) (R50) (R51) (R52) (R53) (R54) (R55) (R56) (R57) (R58) (R59) (R60) (R879) (R880) (R881) (R882) (R883) (R884) (R885) (R886) (R887) (R888) (R889) (R890) (R891) (R892) (R893) (R894) (R895) (R896) (R897) (R898) (R899) (R900) (R901) (R902) (R903) (R904) (R905) (R906) (R907) (R908) (R909) (R910) (R911) (R912) (R913) (R914) (R915) (R916) (R917) (R918) (R919) (R920) (R921) (R922) (R923) (R924) (R925) (R926) (R927) (R928) (R929) (R930) (R931) (R932) (R933) (R934) (R935) (R936) (R937) (R938) (R939) (R940) (R941) (R942) (R943) (R944) (R945) (R946) (R947) (R948) (R949) (R950) (R951) (R952) (R953) (R954) (R955) (R956) (R957) (R958) (R959) (R960) (R961) (R962) (R963) (R964) (R965) (R966) (R967) (R968) (R969) (R970) (R971) (R972) (R973) (R974) (R975) (R976) (R977) (R978) (R979) (R980) (R981) (R982) (R983) (R984) (R985) (R986) (R987) (R988) (R989) (R990) (R991) (R992) (R993) (R994) (R995) (R996) (R997) (R998) (R999) (R1000)		<b>EFFECTS OF SHORT-TERM EXPOSURE</b> The substance is irritating to the eyes, the skin and the respiratory tract. Inhalation of the liquid may cause aspiration into the lungs with the risk of chemical pneumonia. The substance may cause effects on the central nervous system. Exposure of high levels may result in unconsciousness.	
<b>PHYSICAL PROPERTIES</b>		<b>EFFECTS OF LONG-TERM OR REPEATED EXPOSURE</b> The liquid irritates the skin. The substance may have effects on the central nervous system. Exposure to the substance may irritate the respiratory tract. Exposure to the substance may irritate the skin. The substance is probably carcinogenic to humans. See MSDS.	

Guidelines are prepared for educating workers, increasing public awareness.... And..

And primary health care workers who is expected to diagnose the conditions early, timely ....

# Occupational health

A manual for primary health care workers

World Health Organization  
Regional Office for the Eastern Mediterranean  
Cairo  
2001

5.2 Organic solvents and biological tests used for detection of exposure

Organic solvent and its health effects	Methods of evaluation of exposure
<b>Trichloroethane</b> Acute exposure: Mercuric membrane and skin irritant. Neurosis. Capable of sensitizing the myocardium to adrenaline thereby causing arrhythmias. Chronic exposure: Dry, scaly dermatitis.	Trichloroethane, trichloroethanol and trichloroacetic acid in expired air, blood and urine.
<b>Trichloroethylene</b> Acute exposure: Powerful narcotic, action exacerbated by ethanol. Mild respiratory and skin irritant. Chronic exposure: Peripheral neuropathy has been reported. Addictive.	Expired air for trichloroethylene and trichloroacetic acid. Trichloroethanol and trichloroacetic acid in blood or urine.

**Manganese**

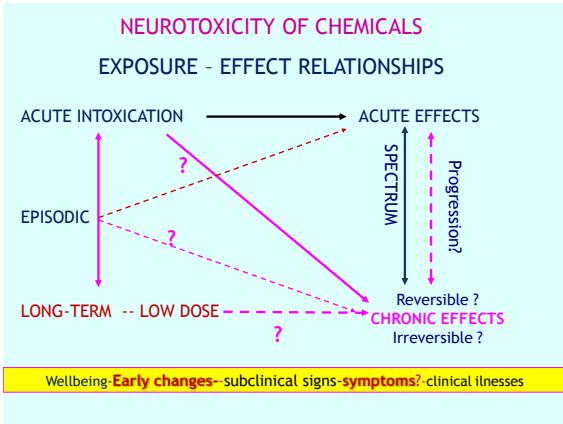

- to: essential of diagnosis
- Acute effects:
  - fever
  - chills
  - Asymptomatic (latent) form (fever)
- Chronic effects:
  - Parkinson-like syndrome
  - behavioral syndrome
  - parosmia
- to: diagnosis

The estimation of manganese in biological fluids does not help in early diagnosis. Detection of the disease in the clinical stage depends on the neurophysiological manifestations.

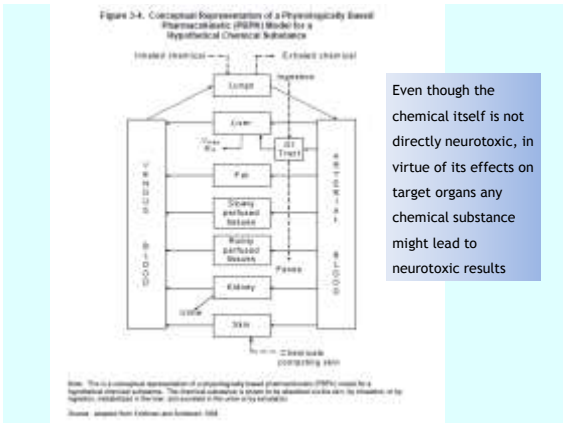

The investigation of chronic exposure is usually done by biological monitoring and usually clinically overt conditions can be detected which are mostly diseases and its important that some early signals of chronic exposure should be included in these guidelines

In my opinion detection of Early sensory disturbances might be important in this perspective and simple tools may be integrated in these type of guidelines

for example the wellknown Neurobehavioral Core Test Battery- WHO questionnaire may be integrated in these type of guidelines.

- ### Exposure-effect relationship
- Acute or chronic
  - Features of chemicals (type, danger, toxicologic, metabolism, excretion)
  - Age, sex, weight, sensitivity, health status, drug usage, habits
  - Working environment (thermal comfort, interactions of physical conditions, climate, pressure, interactions of organizational issues)
  - Workplace -occupational health policy, enterprise scale, developing country, work organizational level
  - Intake mechanism
    - inhalation(nasal, mouth), oral(oropharyngeal, nasal), cutaneous(touch), eye
  - Target organs, health effects
    - irritation, immunologic effect, toxicologic effect- systemic, peripheric-neurotoxic, carcinogenic, reproductive, hematological, liver, kidney, cardiovascular target organs)

- ### Senses on absorption route---
- Touch-dermal exposure
  - Smell-inhalation-ingestion exposure
  - Taste-inhalation and ingestion exposure
  - Eye-eye exposure
- Since we gather all information from the environment with our senses, some neurobehavioural disturbances might be reflections of disturbed senses. Therefore early signs of sensory impairment deserve further systematic evaluation especially for follow up.

### Sense

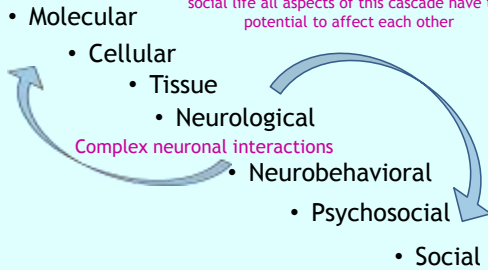

Definition ?

For human ?=? for animal

- ### sensory system
- Vision, sight - ophthalmoception
  - Hearing - audioception-vestibular
  - Smell - olfactoception
  - Taste - gustoception
  - Touch - tactioception
- Balance-Equilibrioception, acceleration, Thermoception, Kinesthetic sence- proprioception, Nocioception, Other intensive senses

## Dimensions ?

Senses have neurobehavioral aspects each of which worth detailed evaluation. Sensory system begins in molecular level and it leads to series of events which influences our even social life all aspects of this cascade have the potential to affect each other

## What do we have?

### Questionnaires

- Q16 (Hogsted et al 1986)-early disturbances for CNS
- Euroquest symptom questionnaire (Gilioli, 1993; Karlson et al., 2000; Chouaniere et al., 1997; Carter et al., 2002),  
-83 items: chronic effects due to exposure, irritative effects due to acute exposure, personality-related features
- World Health Organization(WHO) symptom screening tool(1987) (Anger et al., 2000; World Health Organization,1986)

### Test Batteries and computerized system versions

- Neurobehavioral Core Test Battery-Neurobehavioral core test battery NCBT -40 minutes for screening
- SPES, NES, MANS, AENTB, PENTB, BARS, NESS-2-3,
- BEES- especially epidemiologic repeated applications;
- NEUTEST

## Areas of neurotoxicity assessed with neuropsychological testing

## Sensory Tests

- **Smell**--University of Pennsylvania  
Smell Identification Test (UPSIT),Connecticut  
Chemosensory clinical research center test(CCCRCT),  
Sniffin'sticks, Elsberg Levy's blast Injection method
- **Visual Acuity**-- Snellen
- **Visual Contrast Sensitivity**, Color Vision (Lanthony D15 d)
- **Color Vision** (Lanthony D15 de saturated panel,  
Farnsworth-Munsell 100-hue, farnsworth D15, Ishiara  
plates, standart pseudoisochromatic plates-SPP2, HRR,  
Velhagen-)
- **Visual field** (Nagel Anomaloscope)

## Potential neurophysiological measures of neurotoxicity

**Electroretinograms**-- Evoked responses from the retina in response to visual stimuli

**Flash visual evoked potentials (VEPs)**--Cortical response to simple flashes of illumination

**Pattern visual evoked potentials (VEPs)**--Cortically generated responses elicited by patterns of visual stimuli

**Brainstem auditory evoked potentials (BAEPs)**-- Responses recorded at or near the cortical surface reflecting volume-conducted electrical activity from brainstem generators in auditory pathway

**Middle and late potentials**-- Potentials occurring in auditory cortex approximately 10-50 ms after auditory stimulation

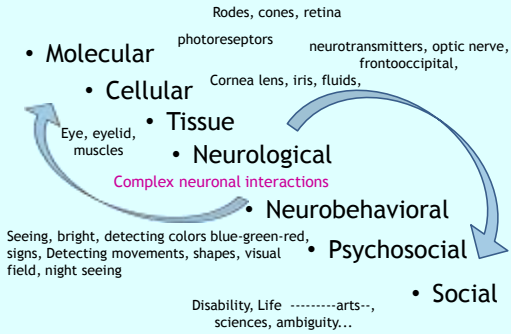

**"Far-field" somatosensory evoked potentials (SSEPs)**-- Elicited by electrical stimulation of nerves, producing a large synchronous afferent volley in the CNS

**Cortical somatosensory potentials**--Recorded from cerebral cortex after presentation of sensory stimuli or direct stimulation of the median nerve

**Cerebellar somatosensory potentials**--Recorded from cerebellum after stimulation of peripheral nerve such as the ventral caudal tail nerve of rats

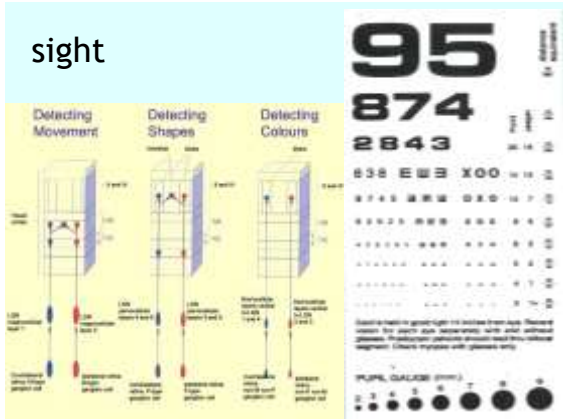

## vision

- [1,3-Butadiene](#)
- [1,4-Dioxane](#)
- [2-Butanone](#)
- [Acrolein](#)
- [Ammonia](#)
- [Carbon Disulfide](#)
- [Chlorine](#)
- [Chlorine Dioxide & Chlorite](#)
- [Dichlorobenzenes](#)
- [Ethylene Oxide](#)
- [Fluorine, Hydrogen Fluoride, and Fluorides](#)
- [Fuel Oils / Kerosene](#)
- [Hydrogen Sulfide](#)
- [Lead](#)
- [Mercury](#)
- [Naphthalene, 1-Methylnaphthalene, 2-Methylnaphthalen](#)
- [Nitrophenols](#)
- [Stoddard Solvent](#)
- [Styrene](#)
- [Sulfur Mustard](#)
- [White Phosphorus](#)

## sight

## Color discrimination, arrangements

acquired colour vision losses are frequently tritan, sometimes termed "blue-yellow" loss  
 These tritan losses may progress to affect red-green colour vision

Iregren et al summarized tests for color vision in occupational health practice and suggested Lantony d-15 desaturated panel for its sensitivity and simplicity

## Contrast sensitivity

Contrast sensitivity loss may reflect long-term cumulative chronic exposure-possibly irreversible damage in neuro-optic pathway.

Inorganic mercury can reduce perception of colour and visual contrast sensitivity and peripheral visual field .  
 Lead may impair Visual contrast sensitivity-solvents, carbondi-sulfide, hegzan, perchloroethylene, styrene, toluene, solvent mixtures, pesticides chlorpyrifos color vision and visual contrast sensitivity.  
 Trichloroethylene, ethyl benzene  
 Nanoparticles

## Hearing

- **Molecular**

- **Cellular**

Ear: inner-middle-external,

- **Tissue**

- **Neurological**

Complex neuronal interactions

- **Neurobehavioral**

- **Psychosocial**

Hearing, equilibrium, anxiety, disability

- **Social**  
Communicating, understanding, warning signals, employability

Neurotransmitters, cilia, haircells, mechanoreceptors,

vestibular nerve, which extends to the vestibular nuclei in the brainstem..

temporal lobe central cortex

Equilibrium organs connection --Fibres from the vestibular nuclei, in turn, extend to cerebellar centres controlling eye movements, and to the spinal cord

## Ototoxic substances

Workplace chemicals thought to be ototoxic either on their own or in combination with noise include:

- **Solvents, mixtures** such as butanol, carbon disulphide, ethyl benzene, heptane, n-hexane, styrene, toluene, trichloroethylene and xylene;
- **metals** such as arsenic, lead, manganese, mercury, dimethylmercury, inorganic mercury and organic tin, cadmium, platinum;
- **pesticides** such as organophosphates and paraquat; and
- **asphyxiants** such as acrylonitrile, carbon monoxide and hydrogen cyanide.

Hearing damage is more likely if exposure is to a combination of substances or to a combination of the substance and noise.

- Medical questionnaire (tinnitus, buzzing, whistling, ringing sound, dizziness, balance, life long history exposure)
- Clinical examination (Weber, rinne)

- **Pure tone Audiometry**

Sensoryneural type hearing loss

- Tympanometry, word discrimination tests, evaluation of the attenuation reflex, electrophysical studies (electrocochleogram, Brainstem auditory evoked potentials (BAEPs)) - and radiological studies (routine skull x rays complemented by CAT scan, MRI)

## Smell

- **Molecular**

- **Cellular**

Nose, mouth

- **Tissue**

- **Neurological**

Complex neuronal interactions

- **Neurobehavioral**

- **Psychosocial**

Personality traits, odour perception, attention, affect, mood

Social preferences, shopping behaviour, Detecting danger, Personality trait? Mate preference

Olfactory neuro epithelium, mucosa, olfactory nerves, olfactory bulb, olfactory tract

### Workplace chemicals reported...

- Cadmium,
- Chromium,
- Nickel
- Organic compounds, solvents mixtures, wood dust, acrylate, metacrylate, hydrogen sulfide

### Sniff tests-Smell

- University of Pennsylvania Smell Identification Test (UPSIT),
- Connecticut Chemosensory clinical research center test(CCCRCT),
- Sniffin'sticks (EU)
- Elsberg Levy's blast Injection method

**Olfactometer**

- Obtaining olfactory evoked potential (OEP) and electro-olfactograms (EOG)
- Measuring smell thresholds
- Producing expert reports (anosmia)
- Quantitative pain measurement (with CO2), testing analgesics
- Tests with MRI and MEG

Typical gases and liquid substances used in olfactometry:

Odorants (to stimulate the olfactory nerve):

- Phenyl ethyl alcohol (PEA) - pleasant stimulant (artificial rose)
- Hydrogen sulphide (H2S) - unpleasant stimulant (bad eggs)

Pain stimulants (to stimulate the trigeminus nerve):

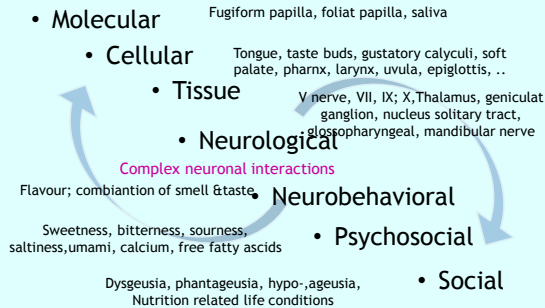

- Carbon dioxide - CO2

Stimulation response to PEA in a young woman. Test by Professor Dr. Hummel, TU Dresden

**Taste**

While evaluating any taste-related problems should be asked in detail ...  
 eg.: Among patients who denied the question "Do you have difficulties in recognizing food or beverages as sweet, sour, bitter, or salty?" no taste disorder was confirmed in 94%. In contrast, the question "Do you have a taste problem?" identified only 10% of the patients with a taste problem.  
 Furthermore, patients should be questioned with regard to salivation, swallowing, chewing, oral pain, previous ear infections (possibly indicated by hearing or balance problems), oral hygiene, and stomach problems.

**Workplace chemicals increase-decrease taste thresholds, disturbances:**

- Organic solvents,
- Chromium
- Toxic metals - cadmium, lead, mercury, biotoxins
- (Panthoglosia-absence of stimulus is well known symptom of metal fume fever)
- Mercury, cadmium can induce structural alterations in taste buds ?

**Taste Strips"**

sweet, sour, salty, and bitter

**Gustometer**

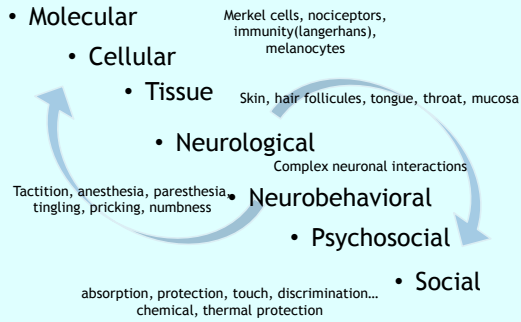

The picture shows the EEG reading (mean of nine individual measurements) for Cz in reaction to a bitter stimulus. A corresponding stimulation with water showed no potential.

The stimuli used in gustometry are:

- citric acid or hydrochloric acid (sour taste),
- caffeine or quinine hydrochloride (bitter taste),
- sodium chloride (salty taste),
- saccharose (sweet taste),
- monosodium glutamate (umami taste).

Tests using principle of electrical stimulation of the tongue are not suggested

## Touch

There are also many chemical substances effecting touch sense and impairment is frequently subclinical

### Lead

Elemental mercury  
1,1,1 trichloroethane,  
styrene,  
solvent mixtures  
n-hexane, toluene,  
Acrylamide,  
Organophosphate and  
other pesticides  
Ethylene oxide  
Xylene

To identify effects of chemicals these examinations have been studied;

- Vibration perception threshold (VPT),
  - two point discrimination,
  - depth sense perception,
  - temperature threshold,
  - pain threshold
- Data on comparability methods are limited

"Your vision and hearing check out fine.  
Now, if you'll turn around my assistant  
will test your sense of humor."

Exposure assessment procedure needs:

- workers' monitoring
- working environments' monitoring

### Workers' monitoring

Follow health status

Symptoms, behavioral evaluations,

Health exams,

### Biologic monitoring,

Chemical, metabolites-- tissue, body fluids,  
urine, exhaled breathing air,

**Working environment monitoring**  
**Occupational Exposure Limit values .....**

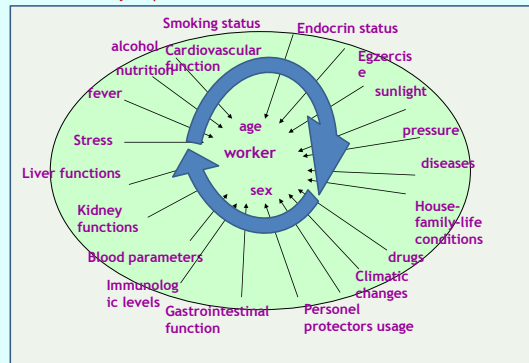

- MAK, TLV (C), TWA, STEL,
- MRLS(ATSDR-2012FEBRUARY)
- NOAEL-no observed adverse effect level
- LOAEL-lowest observed adverse effect level- 'less serious', 'serious'
- AOEL-acceptable operator exposure level

Is biologic and environmental monitoring possible  
 for chronic exposure  
 in «real workplaces» and «real world» of  
 developing countries ???

Chronic exposure is a complicated issue even for the developed countries especially when we consider the potential confounding effect of other environmental factors

Even limit values had been detected and kept we can never be sure about the bodily responses of individuals.

**NEUROTOXICITY OF CHEMICALS**  
**EXPOSURE - EFFECT RELATIONSHIPS**

Wellbeing-**Early changes**- subclinical signs-**symptoms**? clinical illness

**Developing Countries!**

Well recognised -but not well-controlled neurotoxins:	<ul style="list-style-type: none"> <li>• Occupational health services</li> <li>• Poor environmental and biologic monitoring as a survey</li> <li>• lack of facilities and equipment</li> <li>• inadequate information systems</li> <li>• Poor case detection</li> <li>• Limited resources for research competing causes of ill-health (health services transitions, system, organizational issues)</li> </ul>
Metals, Lead, mercury	
Solvents,	
Pesticides-Organophosphates ... others ...	
“New” generation neurotoxins	
e-waste	
PBDE (Polybrominated diphenyl ether)	
Persistent organic pollutants	
Nanomaterials related..... others ...	

## Control hierarchy

- Identify
- Evaluate
- Control
- Eliminate
- Substitute
- Enclose/separate

## Conclusion

- Considerations should be comprehensive -- sensory system impairments might be confounders for neurobehavioral methods
- Might periodic evaluation of all senses together be an early detection tool for chronic exposure ???
- Consensus on standardized questionnaires testing sensory perception in detail
  - Not time consuming, simple, but including all traditional senses,
  - Common language for evaluating senses in chronic exposure
- For widespread use and data collection, collaboration with WHO and ILO, and recommendation and training of occupational health teams are needed

Ramazzini's primacy  
« Prevention is better than cure »

For prevention we need awareness

which can only be found when it is looked for

Let's look for early signs of sensory disturbances
